The Passport System™

The SAFLOK Passport System and SAFLOK MT Locks: State-of-the-Art Design. Top-of-the-Line Features.

Hotel and motel security is important to today's travelers. Guests look for a place to stay that gives them a secure environment. Electronic locks provide that security.

SAFLOK developed the first magnetic stripe card access guest room locking system. SAFLOK has installed many of these advanced locking systems in some of the largest hotels in the world.

SAFLOK adapted this easy to use – yet sophisticated – system to the needs of the small to medium sized hotel and motel market. The result is the SAFLOK Passport System.

The Passport System fits easily at the front desk. There is no wiring between the computer and guest room door locks, perimeter doors or elevator readers. This is achieved with a small, battery powered micro-processor that is built into each lock.

A new guest with a newly encoded keycard instantly locks out previous guest's access by simply inserting the new keycard.

SAFLOK pioneered in the lodging industry by being the original manufacturer of patented locks that did not require removal for rekeying. Our policy is to improve our locks on a continuous basis to help the lodging industry achieve increased security and greater efficiency.

Magnetic card encoding system.

American Banking Association standardized guest room card.

Keycard Expiration

Guest keycards can be programmed to expire on the date and time of check-out. This makes the guest level keycard valid for use in selected doors during an occupant's stay.

Security Audits

The SAFLOK lock used with The Passport System records up to the last 180 date specific entries. Should an incident occur, a report can be obtained that shows the keycards used to access the lock. This report lists (by date and time — and employee and guest identification) all activity associated with the lock use.

Facility Access

A major factor in selecting the SAFLOK Passport System is the ability to have the locks designed to be tailored to a hotel's unique security needs. Control extends beyond guest room access to include swimming pool areas, perimeter doors, hotel health clubs, elevator access to concierge floors and even continental breakfast rooms.

The Passport System™

The Front Desk Passport System

Any hotel's guest room locking system must be designed for ease of use. That is why the Passport System uses a swipe or motorized encoder to reliably issue magnetic stripe guest keycards.

The Passport System is compact in size. The network version of Passport makes it easy to add additional front desk stations. In smaller hotels, a version of the Passport System can be configured with one swipe encoder and one hand-held terminal.

Operation by hotel staff is a snap. Employees appreciate how easy it is to use. A training video is included with the system should additional training be required. The SAFLOK MT lock can accommodate the use of smart cards if the hotel elects this upgrade in the future.

Flexibility for small to mid-size hotels

The design concept of The Passport System gives a property the flexibility to meet unique operating requirements. This includes sections for individual guest rooms, suites, maids, inspection and engineering, floor sections, grand master and emergency keys, inhibit (or guest lockout) and latch open functions.

Computer (PMS) Interface

Easy is the way to describe the interface between the Passport System and Property Management systems.

Key Verification

The key verification shows the room number of the guest and the anticipated guest check-out date. SAFLOK encoding also has the ability to write to Track 1 and Track 2 for use with point-of-sale systems.

Key verification.

SAFLOK STANDARD LEVELS

Guest Level

Each guest room keycard can be programmed to open one guest room. Suite keycards can be programmed to open multiple guest rooms and connecting rooms. It can also be programmed to allow perimeter and facility access.

Maid and Housekeeping Inspection Levels

Each maid keycard can be programmed to open only the doors of a selected hotel area, such as a specific floor, wing or maid section. Maids' keycards are denied access if the guest has engaged the dead bolt. Maids' keycards can also be programmed to give access to specific perimeter doors and maids' closets.

Maintenance Level

This keycard can be programmed for access to some or all doors, facilities and perimeter entrances for maintenance purposes. Maintenance personnel can only open a door lock if the guest has not engaged their dead bolt.

Emergency Level

These keycards will open all doors, including guest rooms, meeting rooms, closets, etc. This restricted keycard is normally used by security and senior management personnel. It is capable of overriding the dead bolt for emergency purposes.

The SAFLOK Passport System

The SAFLOK MT

This top-of-the-line electronic lock is a full mortise locking system. The lock has a one inch throw dead bolt (25 mm) and a three-quarters inch latch (19 mm). Meets all requirements for ANSI/ BHMA 156.13, 1994, Grade 1.

The SAFLOK MT is also available as an automatic dead bolt lock.

The SAFLOK Premier

The Premier features a tubular latch and dead bolt for retrofit to existing cylindrical door preparations. It has a sturdy one inch dead bolt (25 mm) and a 3/8 inch (16 mm) dead-locking latch.

The SAFLOK ADB Select

The Select ADB provides automatic dead bolt protection. This unique mortise lock offers a one inch throw dead bolt (25 mm) that engages each time the door is closed.

The SAFLOK Select ADB with Decorative Plate

The Select ADB vintage handle and rope trim plate is offered as an option.

SAFLOK MT with Vintage Plate

The optional vintage trim plate lends an antique style to the SAFLOK product line.
